In this project we were learning about SimpleAccessibility, this allows to the people who has a problem for hear or if the are a little blind, personally I didn't know about this option

We'll use TalkBack for Test the app, and in the first try of the app with talkback we can see the app isn't very useful when we are using talkback

Now we learned than we need to add the property content description, that way talk have something to read to the user, also in the case of image view the content description will be make it focusable

When we are on the ImageView and this don't have the property focusable = true, should not be able to read it, but in my case I can read it

If we use the property level for is better for TalkBack but this is available just after API 17
